

●● Global PR Media Coverage Automation

Two connected paths to turn up to **45 hours of weekly copy-paste** into a short, auditable review process.

FASTEST VIEW FROM GITHUB

Code > Codespaces > Create > pnpm dev

PLAN 1 / PR-OWNED BRIDGE

Coverage Copilot

2-4 week pilot

WORKFLOW

Muck Rack > Excel > Agent > Existing Lark dashboard

WHAT HAPPENS

- Keeps the current workflow and output; automates export, cleanup, classification, PIC assignment, and data entry.
- Processes high-confidence rows automatically and sends only uncertain products, reporters, outlets, or PICs for review.
- Best for immediate adoption with light IT/security support and no Muck Rack API requirement.

Next action: PR provides one anonymized export, the Lark template, product aliases, PIC rules, and about 200 validated rows; appoint one pilot owner.

OPEN THE INTERACTIVE DEMO

1. Read this page.
2. In GitHub, choose Code > Codespaces > Create codespace on main.
3. Run **pnpm dev** and open the forwarded port.

Then follow **START_HERE.md** for the five-screen walkthrough. GitHub access is required; local Node/pnpm instructions are included as a fallback.

PLAN 2 / DEVELOPER-BUILT TARGET

PR Intelligence Hub

4-8 week MVP

WORKFLOW

Muck Rack/API > Processing engine > Review > Lark + live insights

WHAT HAPPENS

- Replaces spreadsheet assembly with a secure internal app, database, exception inbox, dashboard, and audit history.
- Adds product/campaign/sentiment analysis, editable PIC rules, Lark Base synchronization, and evidence-linked monthly briefs.
- Starts with Excel upload; adds scheduled Muck Rack ingestion after API entitlement, security, and data-retention review.

Next action: Developers validate API access and Lark permissions, then build ingestion, review, rules, audit, dashboard, and export before live sync.

IMPLEMENTATION HANDOFF

PR lead: authorize an anonymized Plan 1 pilot. **Developers:** reuse its parser, taxonomy, PIC rules, validation set, and review behavior in Plan 2.

Success gates: every row reconciled; product $\geq 95\%$; PIC $\geq 97\%$ where a documented rule exists; no low-confidence record silently published.
